Apparatus.--A calorimeter (an aluminum beaker will do); a thermometer; ice or snow; salt if necessary. Directions.--a. Rub the outside of the calorimeter till it is bright. Fill it about half full of water. Gradually cool the water by adding ice or snow, watching the outside of the beaker after each addition and continually stirring the contents with the thermometer. As soon as a mist begins to form on the bright surface near the bottom of the calorimeter, cease adding ice and note accurately the temperature. If unable to produce the desired result, add a little salt with the ice. b. It is probable that the temperature thus observed will be a little below the dew point (true dew point). Therefore remove any remaining pieces of ice and warm the water a little by making small additions of water at the temperature of the room. Note the temperature at the moment the mist begins to disappear. This temperature will probably be a little higher than the true dew point, which can be found by taking the mean of the two observed temperatures in a and b. Note If a thick layer of moisture forms on the beaker before the warming process is begun, it should be wiped off and a thin layer allowed to form. c. Record the temperature of the room,...
