In From the preceding example, it appears, that the Binomial Theorem may not only be employed in extracting imperfect roots, but also in finding quotients. Thus,  $j$ -, evidently expresses the quotient of a divided by the cube root of  $(-y)$ . If, by means of this theorem, the student find the quotients of a divided by  $a+x$ , and of a divided by  $a-x$ , or, which is the same thing, expand  $a(a x)$ , and  $a(a-x)$  into infinite series, he will find the results to agree with those stated on page 68, as found by actual division. The Binomial Theorem may be very conveniently employed for extracting imperfect roots of numbers, more particularly when the number exceeds the complete power, whose root is to be extracted by a very little. Ex. Required the cube root of 29. i i i 1 2 1 22, 9s 2 4 40 c.) = 3(1+ +3595523-c.) = (rejecting the last fraction) 3(1+0.0240817) = 3.0722451 nearly. In all examples of this kind,...
